GoldenEye Recomp — Online Server

A tiny, standalone **matchmaker + UDP relay** that lets people play the [GoldenEye 007 recompilation](#) online together over the internet.

One person runs this server and shares its address; everyone enters that same address in the game's **ONLINE** menu and they can find and join each other's matches.

This is just the server. You need the game itself — see the [GoldenEye-Recomp](#) repo.

How it works

The game already speaks the Xbox 360 System Link network protocol. This server sits in the middle and does two jobs:

- Matchmaker** — hosts register their game; players query for the list.
- Relay** — forwards the game's LAN broadcast/unicast packets between players (loopback/LAN broadcast can't cross the internet on its own). Each player is given a virtual `10.0.0.x` identity used for routing.

Because every player connects **out** to the server, **no port-forwarding is needed for players** — only the host needs the server's one UDP port reachable.

Build

Requires CMake and a C++17 compiler.

```
cmake -S . -B build
cmake --build build --config Release
```

- Windows:** links `ws2_32` automatically. Output: `build/ge_server.exe` (or `build/Release/ge_server.exe`).
- Linux:** `g++ -O2 -std=c++17 src/server.cpp -o ge_server` also works.

Run

Windows (easy): double-click `host_server.bat`. Edit the two lines at the top first if you want:

```
set "BIND_IP=0.0.0.0" REM 0.0.0.0 = listen on everything (normal)
set "PORT=31000" REM UDP port players/your tunnel use
```

Any OS: `ge_server [bind_ip] [port]` — both optional, default `0.0.0.0 31000`.

Keep the window open while hosting.

Whatever you use, friends put **your reachable address + the same port** in their game's ONLINE menu.

Setup	Friends connect to	Notes
Same PC / LAN	your LAN IP (<code>ipconfig</code>)	nothing else needed
Hamachi	your Hamachi IP	easy, no port-forward
playit.gg	the address playit gives you	free tunnel, no port-forward; use the playit port
Public / VPS	your public IP	forward UDP <code>31000</code> , or host on a cheap/free VPS

See [DEPLOY.md](#) for a full always-on deployment guide (e.g. a free Oracle Cloud instance).

Notes

- The wire protocol (`src/ge_net_protocol.h`) must stay byte-identical to the game client's copy — don't change it without changing the game too.
- The server forwards opaque game data; it does not read or modify gameplay.
